

UHC Survey Year 2 — Official Codebook

Generated 2026-07-22 01:19 UTC from the build artifacts (dictionary + question text + skip-logic/validation spec) — regenerate, never hand-edit. Variable documentation follows the DDI-Codebook 2.5 element set used by the PSA Data Archive (PSADA/NADA); presentation follows the DHS recode-manual table style.

Values in the datasets are RAW stored codes; this codebook is the labeling truth.

Missing-value conventions (Shared Codebook v0.8 / tracker #743):

categorical items: 8 / 98 = Don't know · 9 / 99 = Refused (per value set)

amount/continuous items: -98 = Don't know · -99 = Refused (negative sentinels)

harmonized Stata output maps these to .c (DK), .b (Refused), .a (skip-logic NOTAPPL)

questionnaire_number is a 12-digit string key (RR-PP-MMM-FF-CCC); breakout exports may drop a leading region zero — restore by zero-filling to 12.

Skip logic: 'Universe / applicability' = who is asked (derived from the Skip-Logic spec); outbound routing shown on the variable that triggers it. Executable truth stays in the instrument logic (.apc).

Validation & editing: per-variable rules in 'Validation rules' + the Validations sheet (HARD = block save, SOFT = warn-and-confirm, GATE = display-only) — maps to DDI's data-editing/cleanOps element at dissemination.

DDI mapping: Variable→var/@name · Label→var/label · Question→var/qstn · Universe→var/universe · Values→var/catgry · Special codes→missing · packaged as DDI 2.5 at dissemination.
